2．如果

```
StringBuffer s1 = new StringBuffer("Java");

或者：s.setLength(0);

4.如果

```
String s1 = "Welcome";
String s2 = new String("Welcome");
String s3 = s2.intern();
String s4 = "Wel" + "come";
String s5 = "Wel";
String s6 = "come";
String s7 = s5 + s6;
String s8 = "Wel" + new String("come");
```

那么下面表达式的结果为：

```
class C {
    public static void main(String[] args) {
        String s = “null”;
```

```
        if(s == null)
            System.out.print("a");
        else if(s.length() == 0)
            System.out.print("b");
        else
            System.out.print("c");
    }
}
```

的输出为___C_____。

(A) a　　(B) b

(C) c　　(D) null

3．下面的程序

```
class C {
    public static void main(String[] args) {
        String s = "Welcome to ";
        concat(s);
        System.out.print(s);
    }
    public static void concat(String s) {
        s += "Java";
    }
}
```

的输出为___A_____。

三、编程题

1：编写程序，从控制台或对话框任意输入一个英文字符串，统计字符串中每个英文字母出现的次数并输出到控制台（大小写不敏感）。

2：假设一个车牌号码由三个大写字母和后面的四个数字组成。编写一个程序．生成 5 个不重复的车牌号码。

1:参考答案:

```
public class CountEachLetter {
    /** Main method */
    public static void main(String[] args) {
        // Prompt the user to enter a string
        String s = JOptionPane.showInputDialog("Enter a string:");

        // Invoke the countLetters method to count each letter
        int[] counts = countLetters(s.toLowerCase());

        // Declare and initialize output string
        String output = "";

        // Display results
        for (int i = 0; i < counts.length; i++) {
            if (counts[i] != 0)

                // (char)('a' + i ) : 得到 counts 数组第 i 个元素对应的是哪个字符

                output += (char) ('a' + i) + " appears  " + counts[i]
                        + ((counts[i] == 1) ? " time\n" : " times\n");
        }

        // Display the result
        JOptionPane.showMessageDialog(null, output);
    }

    // Count each letter in the string
    public static int[] countLetters(String s) {
        int[] counts = new int[26];

        for (int i = 0; i < s.length(); i++) {
            if (Character.isLetter(s.charAt(i)))

                //s.charAt(i) - 'a'计算第 i 个字母在 counts 数组中对应的索引，以便计数+1

                counts[s.charAt(i) - 'a']++;
        }

        return counts;
    }
}
```
